1 Overview

The Swift Navigation Binary Protocol (SBP) is a fast, simple, and minimal binary protocol for communicating with Swift devices. It is the native binary protocol used by the Piksi GPS receiver to transmit solutions, observations, status, and debugging messages, as well as receive messages from the host operating system, such as differential corrections and the almanac. As such, it is an important interface with your Piksi receiver and the primary integration method with other systems.

This document provides a specification of SBP framing and the payload structures of the messages currently used with Swift devices. SBP client libraries in a variety of programming languages are available at https://github.com/swift-nav/libsbp and support information for sbp is available at https://support.swiftnav.com/customer/en/portal/articles/2492810-swift-binary-protocol.

2 Message Framing Structure

SBP consists of two pieces:

- an over-the-wire message framing format
- structured payload definitions

As of Version 2.7.1, the frame consists of a 6-byte binary header section, a variable-sized payload field, and a 16-bit CRC value. All multibyte values are ordered in **little-endian** format. SBP uses the CCITT CRC16 (XMODEM implementation) for error detection¹.

| Offset (bytes) | Size (bytes) | Name | Description |
|-------------------|--------------|-----------------|--|
| 0 | 1 | Preamble | Denotes the start of frame transmission. Always 0x55. |
| 1 | 2 | Message Type | Identifies the payload contents. |
| 3 | 2 | Sender | A unique identifier of the sender. On the Piksi, this is set to the 2 least significant bytes of the device serial number. A stream of SBP messages may also include sender IDs for forwarded messages. By default, clients of 'libsbp' use a sender id value of '0x42'. Sender id '0x42' is used to represent device controllers such as the Piksi Console. |
| 5 | 1 | Length | Length (bytes) of the Payload field. |
| 6 | Ν | Payload | Binary message contents. |
| N + 6 | 2 | CRC | Cyclic Redundancy Check of the frame's binary data from the Message Type up to the end of Payload (does not include the Preamble). |
| | N + 8 | | Total Frame Length |

Table 2.0.1: Swift Binary Protocol message structure. N denotes a variable-length size.

3 NMEA-0183

Swift devices, such as the Piksi, also have limited support for the standard NMEA-0183 protocol.

Note that NMEA-0183 doesn't define standardized message string equivalents for many important SBP messages such as observations, baselines and ephemerides. For this reason it is strongly recommended to use SBP for new development. NMEA-0183 output is provided primarily to support legacy devices.

 $^{^1}$ CCITT 16-bit CRC Implementation uses parameters used by XMODEM, i.e. the polynomial: $x^{16} + x^{12} + x^5 + 1$. For more details, please see the implementation at https://github.com/swift-nav/libsbp/blob/master/c/src/edc.c#L59. 4 Basic Formats and Payload Structure

The binary payload of an SBP message decodes into structured data based on the message type defined in the header. SBP uses several primitive numerical and collection types for defining payload contents.

| Name | Size (bytes) | Description | |
|----------|--------------|---|--|
| s8 | 1 | Signed 8-bit integer | |
| s16 | 2 | Signed 16-bit integer | |
| s32 | 4 | Signed 32-bit integer | |
| s64 | 8 | Signed 64-bit integer | |
| u8 | 1 | Unsigned 8-bit integer | |
| u16 | 2 | Unsigned 16-bit integer | |
| u32 | 4 | Unsigned 32-bit integer | |
| u64 | 8 | Unsigned 64-bit integer | |
| float | 4 | Single-precision float (IEEE-754) | |
| double | 8 | Double-precision float (IEEE-754) | |
| array | _ | Fixed or variable length array of any fill type | |
| string | _ | Fixed or variable length string (NULL padded/terminated) | |
| bitfield | _ | A primitive type, typically a u8, can encode boolean and enumerated status flags. | |

Example Message

As an example, consider this framed series of bytes read from a serial port:

55 02 02 cc 04 14 70 3d d0 18 cf ef ff ff ef e8 ff ff f0 18 00 00 00 05 00 43 94

This byte array decodes into a MSG_BASELINE_ECEF (see pg. 16), which reports the baseline position solution of the rover receiver relative to the base station receiver in Earth Centered Earth Fixed (ECEF) coordinates. The segments of this byte array and its contents break down as follows:

| Field Name | Туре | Value | Bytestring Segment |
|-------------------|------|---------------------------|-------------------------------------|
| Preamble | u8 | 0x55 | 55 |
| Message Type | u16 | MSG_BASELINE_ECEF | 02 02 |
| Sender | u16 | 1228 | cc 04 |
| Length | u8 | 20 | 14 |
| Payload | | _ | 70 3d d0 18 cf ef ff ff ef e8 ff ff |
| | | | f0 18 00 00 00 00 05 00 |

5 Message Types

Packages define a logical collection of SBP messages. The contents and layout of messages in packages marked **stable** are unlikely to change in the future. **Draft** messages *will change with future development* and are detailed purely for *informational purposes only*. Many draft messages are implementation-defined, and some collections, such as the acquisition package, are used for internal development.

6 Stable Message Definitions

6.1 Ext Events

Messages reporting accurately-timestamped external events, e.g. camera shutter time.

$\mathsf{MSG_EXT_EVENT} - 0\mathsf{x}0101 - 257$

Reports detection of an external event, the GPS time it occurred, which pin it was and whether it was rising or falling.

| Offset (bytes) | Size (bytes) | Format | Units | Name | Description |
|-------------------|--------------|--------|-------|-------------|--|
| 0 | 2 | u16 | weeks | wn | GPS week number |
| 2 | 4 | u32 | ms | tow | GPS time of week rounded to the nearest millisecond |

6.2 Imu

Inertial Measurement Unit (IMU) messages.

MSG_IMU_RAW — 0x0900 — 2304

Raw data from the Inertial Measurement Unit, containing accelerometer and gyroscope readings. The sense of the measurements are to be aligned with the indications on the device itself. Measurement units, which are specific to the device hardware and settings, are communicated via the MSG_IMU_AUX message.

| Offset (bytes) | Size (bytes) | Format | Units | Name | Description |
|----------------|--------------|--------|----------|---------|---|
| 0 | 4 | u32 | ms | tow | Milliseconds since start of GPS week. If the high bit is set, the time is unknown or invalid. |

6.3 Logging

Logging and debugging messages from the device.

$MSG_LOG - 0x0401 - 1025$

This message contains a human-readable payload string from the device containing errors, warnings and informational messages at ERROR, WARNING, DEBUG, INFO logging levels.

| Offset (bytes) | Size (bytes) | Format | Units | Name | Description |

$MSG_FWD - 0x0402 - 1026$

This message provides the ability to forward messages over SBP. This may take the form of wrapping up SBP messages received by Piksi for logging purposes or wrapping another protocol with SBP.

The source identifier indicates from what interface a forwarded stream derived. The protocol identifier identifies what the expected protocol the forwarded msg contains. Protocol 0 represents SBP and the remaining values are implementation defined.

6.4 Mag

Magnetometer (mag) messages.

$MSG_MAG_RAW - 0x0902 - 2306$

Raw data from the magnetometer.

| Offset (bytes) | Size (bytes) | Format | Units | Name | Description |
|-------------------|--------------|--------|-------------|-----------------------------|---|
| 0 | 4 | u32 | ms | tow | Milliseconds since start of GPS week. If the high bit is set, the time is unknown or invalid. |

6.5 Navigation

Geodetic navigation messages reporting GPS time, position, velocity, and baseline position solutions. For position solutions, these messages define several different position solutions: single-point (SPP), RTK, and pseudo-absolute position solutions.

The SPP is the standalone, absolute GPS position solution using only a single receiver. The RTK solution is the differential GPS solution, which can use either a fixed/integer or floating carrier phase ambiguity. The pseudo-absolute position solution uses a user-provided, well-surveyed base station position (if available) and the RTK solution in tandem.

When the inertial navigation mode indicates that the IMU is used, all messages are reported in the vehicle body frame as defined by device settings. By default, the vehicle body frame is configured to be coincident with the antenna phase center. When there is no inertial navigation, the solution will be reported at the phase center of the antenna. There is no inertial navigation capability on Piksi Multi or Duro.

$MSG_GPS_TIME - 0x0102 - 258$

This message reports the GPS time, representing the time since the GPS epoch began on midnight January 6, 1980 UTC. GPS time counts the weeks and seconds of the week. The weeks begin at the Saturday/Sunday transition. GPS week 0 began at the beginning of the GPS time scale.

Within each week number, the GPS time of the week is between 0 and 604800 seconds (=60*60*24*7). Note that GPS time does not accumulate leap seconds, and as of now, has a small offset from UTC. In a message stream, this message precedes a set of other navigation messages referenced to the same time (but lacking the ns field) and indicates a more precise time of these messages.

MSG_POS_ECEF — 0x0209 — 521

The position solution message reports absolute Earth Centered Earth Fixed (ECEF) coordinates and the status (single point vs pseudo-absolute RTK) of the position solution. If the rover receiver knows the surveyed position of the base station and has an RTK solution, this reports a pseudo-absolute position solution using the base station position and the rover's RTK baseline vector. The full GPS time is given by the preceding MSG_GPS_TIME with the matching time-of-week (tow).

The position solution message reports absolute Earth Centered Earth Fixed (ECEF) coordinates and the status (single point vs pseudo-absolute RTK) of the position solution. The message also reports the upper triangular portion of the 3x3 covariance matrix. If the receiver knows the surveyed position of the base station and has an RTK solution, this reports a pseudo-absolute position solution using the base station position and the rover's RTK baseline vector. The full GPS time is given by the preceding MSG_GPS_TIME with the matching time-of-week (tow).

$MSG_POS_LLH_COV - 0x0211 - 529$

This position solution message reports the absolute geodetic coordinates and the status (single point vs pseudo-absolute RTK) of the position solution as well as the upper triangle of the 3x3 covariance matrix. The position information and Fix Mode flags should follow the MSG_POS_LLH message. Since the covariance matrix is computed in the local-level North, East, Down frame, the covariance terms follow with that convention. Thus, covariances are reported against the "downward" measurement and care should be taken with the sign convention.

MSG_VEL_BODY — 0x0213 — 531

This message reports the velocity in the Vehicle Body Frame. By convention, the x-axis should point out the nose of the vehicle and represent the forward direction, while as the y-axis should point out the right hand side of the vehicle. Since this is a right handed system, z should point out the bottom of the vehicle. The orientation and origin of the Vehicle Body Frame are specified via the device settings. The full GPS time is given by the preceding MSG_GPS_TIME with the matching time-of-week (tow). This message is only produced by inertial versions of Swift products and is not available from Piksi Multi or Duro.

6.6 Observation

Satellite observation messages from the device.

$MSG_{-}OBS - 0x004A - 74$

The GPS observations message reports all the raw pseudorange and carrier phase observations for the satellites being tracked by the device. Carrier phase observation here is represented as a 40-bit fixed point number with Q32.8 layout (i.e. 32-bits of whole cycles and 8-bits of fractional cycles). The observations are be interoperable with 3rd party receivers and conform with typical RTCMv3 GNSS observations.

| Offset (bytes) | Size (bytes) | Format | Units | Name | Description |
|-------------------|--------------|--------|--------------|--------------|--|
| 0 | 4 | u32 | ms | header.t.tow | Milliseconds since start of GPS week |
| 4 | 4 | s32 | ns | header.t.ns_ | residual of millisecond-rounded TOW (ranges from -500000 to 500000) |
| 8 | 2 | u16 | week | header.t.wn | GPS week number |
| 10 | 1 | u8 | | header.n_obs | Total number of observations. First nibble is the size of the sequence (n), second nibble is the zero-indexed counter (ith packet of n) |
| 17N + 11 | 4 | u32 | 2 cm | obs[N].P | Pseudorange observation |
| 17N + 15 | 4 | s32 | cycles | obs[N].L.i | Carrier phase whole cycles |

| 17N + 22 | 1 | u8 | Hz / 256 | obs[N].D.f | Doppler fractional part |
| 17N + 23 | 1 | u8 | dB Hz / 4 | obs[N].cn0 | Carrier-to-Noise density. Zero implies invalid cn0. |
| 17 <i>N</i> + 24 | 1 | u8 | | obs[N].lock | Lock timer. This value gives an indication of the time for which a signal has maintained continuous phase lock. Whenever a signal has lost and regained lock, this value is reset to zero. It is encoded according to DF402 from the RTCM 10403.2 Amendment 2 specification. Valid values range from 0 to 15 and the most significant nibble is reserved for future use. |
| 17 <i>N</i> + 25 | 1 | u8 | | obs[N].flags | Measurement status flags. A bit field of flags providing the status of this observation. If this field is 0 it means only the Cn0 estimate for the signal is valid. |
| 17 <i>N</i> + 26 | 1 | u8 | | obs[N].sid.s | This field for Glonass can either be (100+FCN) where FCN is in [-7,+6] or the Slot ID in [1,28] |

6.7 Settings

Messages for reading, writing, and discovering device settings. Settings with a "string" field have multiple values in this field delimited with a null character (the c style null terminator). For instance, when querying the 'firmware_version' setting in the 'system_info' section, the following array of characters needs to be sent for the string field in $MSG_SETTINGS_READ$: "system_info\0firmware_version\0", where the delimiting null characters are specified with the escape sequence '\0' and all quotation marks should be omitted.

In the message descriptions below, the generic strings SECTION_SETTING and SETTING are used to refer to the two strings that comprise the identifier of an individual setting. In firmware_version example above, SECTION_SETTING is the 'system_info', and the SETTING portion is 'firmware_version'.

See the "Software Settings Manual" on support.swiftnav.com for detailed documentation about all settings and sections available for each Swift firmware version. Settings manuals are available for each firmware version at the following link: Piksi Multi Specifications. The latest settings document is also available at the following link: Latest settings document. See lastly settings.py , the open source python command line utility for reading, writing, and saving settings in the piksi_tools repository on github as a helpful reference and example.

$MSG_SETTINGS_SAVE - 0x00A1 - 161$

The save settings message persists the device's current settings configuration to its onboard flash memory file system.

| Offset (bytes) | Size (bytes) | Format | Units | Name | Description |
|----------------|--------------|--------|-------|------|----------------------|
| | 0 | | | | Total Payload Length |

Table 6.7.1: MSG_SETTINGS_SAVE 0x00A1 message structure

$MSG_SETTINGS_WRITE - 0x00A0 - 160$

The setting message writes the device configuration for a particular setting via A NULL-terminated and NULL-delimited string with contents "SECTION_SETTING\0SETTING\0VALUE\0" where the '\0' escape sequence denotes the NULL character and where quotation marks are omitted. A device will only process to this message when it is received from sender ID 0x42. An example string that could be sent to a device is "solution\0soln_freq\010\0".

| Offset (bytes) | Size (bytes) | Format | Units | Name | Description |

| | Ν | | | | Total Payload Length |

Table 6.7.2: MSG_SETTINGS_WRITE 0x00A0 message structure

$MSG_SETTINGS_WRITE_RESP - 0x00AF - 175$

Return the status of a write request with the new value of the setting. If the requested value is rejected, the current value will be returned. The string field is a NULL-terminated and NULL-delimited string with contents "SECTION_SETTING\0SETTING\0VALUE\0" where the '\0' escape sequence denotes the NULL character and where quotation marks are omitted. An example string that could be sent from device is "solution\0soln_freq\010\0".

Table 6.7.4: Write status values (status[0:1])

$MSG_SETTINGS_READ_REQ - 0x00A4 - 164$

The setting message that reads the device configuration. The string field is a NULL-terminated and NULL-delimited string with contents "SECTION_SETTING\0SETTING\0" where the '\0' escape sequence denotes the NULL character and where quotation marks are omitted. An example string that could be sent to a device is "solution\0soln_freq\0". A device will only respond to this message when it is received from sender ID 0x42. A device should respond with a MSG_SETTINGS_READ_RESP message (msg_id 0x00A5).

6.8 System

Standardized system messages from Swift Navigation devices.

MSG_STARTUP — 0xFF00 — 65280

The system start-up message is sent once on system start-up. It notifies the host or other attached devices that the system has started and is now ready to respond to commands or configuration requests.

MSG_HEARTBEAT — 0xFFFF — 65535

The heartbeat message is sent periodically to inform the host or other attached devices that the system is running. It is used to monitor system malfunctions. It also contains status flags that indicate to the host the status of the system and whether it is operating correctly. Currently, the expected heartbeat interval is 1 sec.

The system error flag is used to indicate that an error has occurred in the system. To determine the source of the error, the remaining error flags should be inspected.

7 Draft Message Definitions

7.1 Acquisition

Satellite acquisition messages from the device.

MSG ACQ RESULT — 0x002F — 47

This message describes the results from an attempted GPS signal acquisition search for a satellite PRN over a code phase/carrier frequency range. It contains the parameters of the point in the acquisition search space with the best carrier-to-noise (CN/0) ratio.

| Offset (bytes) | Size (bytes) | Format | Units | Name | Description |

7.2 File IO

Messages for using device's onboard flash filesystem functionality. This allows data to be stored persistently in the device's program flash with wear-levelling using a simple filesystem interface. The file system interface (CFS) defines an abstract API for reading directories and for reading and writing files.

Note that some of these messages share the same message type ID for both the host request and the device response.

MSG FILEIO READ REQ — 0x00A8 — 168

The file read message reads a certain length (up to 255 bytes) from a given offset into a file, and returns the data in a MSG_FILEIO_READ_RESP message where the message length field indicates how many bytes were successfully read. The sequence number in the request will be returned in the response. If the message is invalid, a followup MSG_PRINT message will print "Invalid fileio read message". A device will only respond to this message when it is received from sender ID 0x42.

| Offset (bytes) | Size (bytes) | Format | Units | Name | Description |
|-------------------|--------------|--------|-------|------------|-------------------------------|
| 0 | 4 | u32 | | sequence | Read sequence number |
| 4 | 4 | u32 | bytes | offset | File offset |
| 8 | 1 | u8 | bytes | chunk_size | Chunk size to read |
| 9 | N | string | | filename | Name of the file to read from |
| | N + 9 | | | | Total Payload Length |

Table 7.2.1: MSG_FILEIO_READ_REQ 0x00A8 message structure

MSG FILEIO READ RESP — 0×000 A3 — 163

The file read message reads a certain length (up to 255 bytes) from a given offset into a file, and returns the data in a message where the message length field indicates how many bytes were successfully read. The sequence number in the response is preserved from the request.

| Offset (bytes) | Size (bytes) | Format | Units | Name | Description |
|----------------|---------------|--------------|-------|------|--|
| 0 4 | 4 <i>N</i> | u32 u8[N] | | - | Read sequence number Contents of read file |
| | N + 4 | | | | Total Payload Length |

Table 7.2.2: MSG_FILEIO_READ_RESP 0x00A3 message structure

MSG FILEIO READ DIR REQ — 0x00A9 — 169

The read directory message lists the files in a directory on the device's onboard flash file system. The offset parameter can be used to skip the first n elements of the file list. Returns a MSG_FILEIO_READ_DIR_RESP message containing the directory listings as a NULL delimited list. The listing is chunked over multiple SBP packets. The sequence number in the request will be returned in the response. If message is invalid, a followup MSG_PRINT message will print "Invalid fileio read message". A device will only respond to this message when it is received from sender ID 0x42.

| Offset (bytes) | Size (bytes) | Format | Units | Name | Description |
|----------------|--------------|--------|-------|----------|--|
| 0 | 4 | u32 | | sequence | Read sequence number |
| 4 | 4 | u32 | | offset | The offset to skip the first n elements of the file list |

Table 7.2.3: MSG_FILEIO_READ_DIR_REQ 0x00A9 message structure

MSG FILEIO READ DIR RESP — 0×000 AA — 170

The read directory message lists the files in a directory on the device's onboard flash file system. Message contains the directory listings as a NULL delimited list. The listing is chunked over multiple SBP packets and the end of the list is identified by an entry containing just the character 0xFF. The sequence number in the response is preserved from the request.

| Offset (bytes) | Size (bytes) | Format | Units | Name | Description |

Table 7.2.4: MSG_FILEIO_READ_DIR_RESP 0x00AA message structure

MSG FILEIO REMOVE — 0x00AC — 172

The file remove message deletes a file from the file system. If the message is invalid, a followup MSG_PRINT message will print "Invalid fileio remove message". A device will only process this message when it is received from sender ID 0x42.

| Offset (bytes) | Size (bytes) | Format | Units | Name | Description |

| 0 | Ν | string | | filename | Name of the file to delete |
| | Ν | | | | Total Payload Length |

Table 7.2.5: MSG_FILEIO_REMOVE 0x00AC message structure

MSG FILEIO WRITE REQ — 0×000 AD — 173

The file write message writes a certain length (up to 255 bytes) of data to a file at a given offset. Returns a copy of the original MSG_FILEIO_WRITE_RESP message to check integrity of the write. The sequence number in the request will be returned in the response. If message is invalid, a followup MSG_PRINT message will print "Invalid fileio write message". A device will only process this message when it is received from sender ID 0x42.

MSG ORIENT QUAT — 0x0220 — 544

This message reports the quaternion vector describing the vehicle body frame's orientation with respect to a local-level NED frame. The components of the vector should sum to a unit vector assuming that the LSB of each component as a value of 2^-31 . This message will only be available in future INS versions of Swift Products and is not produced by Piksi Multi or Duro.

MSG ORIENT EULER — 0x0221 — 545

This message reports the yaw, pitch, and roll angles of the vehicle body frame. The rotations should applied intrinsically in the order yaw, pitch, and roll in order to rotate the from a frame aligned with the local-level NED frame to the vehicle body frame. This message will only be available in future INS versions of Swift Products and is not produced by Piksi Multi or Duro.

MSG ANGULAR RATE — 0x0222 — 546

This message reports the orientation rates in the vehicle body frame. The values represent the measurements a strapped down gyroscope would make and are not equivalent to the time derivative of the Euler angles. The orientation and origin of the user frame is specified via device settings. By convention, the vehicle x-axis is expected to be aligned with the forward direction, while the vehicle y-axis is expected to be aligned with the right direction, and the vehicle z-axis should be aligned with the down direction. This message will only be available in future INS versions of Swift Products and is not produced by Piksi Multi or Duro.

Table 7.5.11: MSG_THREAD_STATE 0x0017 message structure

MSG UART STATE — 0x001D — 29

The UART message reports data latency and throughput of the UART channels providing SBP I/O. On the default Piksi configuration, UARTs A and B are used for telemetry radios, but can also be host access ports for embedded hosts, or other interfaces in future. The reported percentage values must be normalized. Observations latency and period can be used to assess the health of the differential corrections link. Latency provides the timeliness of received base observations while the period indicates their likelihood of transmission.

MSG FRONT END GAIN — 0x00BF — 191

This message describes the gain of each channel in the receiver frontend. Each gain is encoded as a non-dimensional percentage relative to the maximum range possible for the gain stage of the frontend. By convention, each gain array has 8 entries and the index of the array corresponding to the index of the rf channel in the frontend. A gain of 127 percent encodes that rf channel is not present in the hardware. A negative value implies an error for the particular gain stage as reported by the frontend.

MSG SSR GRID DEFINITION — $0 \times 05F5$ — 1525

Based on the 3GPP proposal R2-1906781 which is in turn based on OMA-LPPe-ValidityArea from OMA-TS-LPPe-V2_0-20141202-C

| Offset (bytes) | Size (bytes) | Format | Units | Name | Description |
|-------------------|-----------------|--------|----------------------|----------------------------|---|
| 0 | 1 | u8 | inverse de- grees | header.region_size_inverse | region_size (deg) = 10 / re- gion_size_inverse 0 is an invalid value. |
| 1 | 2 | u16 | | header.area_width | <pre>grid height (deg) = grid idth (deg) = area_width / region_size 0 is an invalid value.</pre> |
| 3 | 2 | u16 | | header.lat_nw_corner_enc | North-West corner latitdue (deg) = region_size * lat_nw_corner_enc - 90 |
| 5 | 2 | u16 | | header.lon_nw_corner_enc | North-West corner longtitude (deg) = region_size * lon_nw_corner_enc - 180 |
| 7 | 1 | u8 | | header.num_msgs | Number of messages in the dataset |
| 8 | 1 | u8 | | header.seq_num | Postion of this message in the dataset |
| 9 | N | u8[N] | | rle_list | Run Length Encode list of quadrants that contain valid data. The spec describes the encoding scheme in detail, but essentially the index of the quadrants that contain transitions between valid and invalid (and vice versa) are encoded as u8 integers. |
| | N + 9 | | | | Total Payload Length |

7.8 Tracking

Satellite code and carrier-phase tracking messages from the device.

MSG TRACKING STATE — 0x0041 — 65

The tracking message returns a variable-length array of tracking channel states. It reports status and carrier-to-noise density measurements for all tracked satellites.

| Offset (bytes) | Size (bytes) | Format | Units | Name | Description |
|----------------|--------------|--------|-----------|--------------------|--|
| 4 <i>N</i> + 0 | 1 | u8 | | states[N].sid.sat | Constellation-specific satellite identifier. This field for Glonass can either be (100+FCN) where FCN is in [-7,+6] or the Slot ID in [1,28] |
| 4N + 1 | 1 | u8 | | states[N].sid.code | Signal constellation, band and code |
| 4N + 2 | 1 | u8 | | states[N].fcn | Frequency channel number (GLONASS only) |
| 4N + 3 | 1 | u8 | dB Hz / 4 | states[N].cn0 | Carrier-to-Noise density. Zero implies invalid cn0. |
| | 4 <i>N</i> | | | | Total Payload Length |

Value

Description

MSG MEASUREMENT STATE — $0 \times 0061 - 97$

The tracking message returns a variable-length array of tracking channel states. It reports status and carrier-to-noise density measurements for all tracked satellites.

| Offset (bytes) | Size (bytes) | Format | Units | Name | Description |
|-------------------|--------------|--------|-----------|----------------------|--|
| 3 <i>N</i> + 0 | 1 | u8 | | states[N].mesid.sat | Constellation-specific satellite identifier. This field for Glonass can either be (100+FCN) where FCN is in [-7,+6] or the Slot ID in [1,28] |
| 3N + 1 | 1 | u8 | | states[N].mesid.code | Signal constellation, band and code |
| 3N + 2 | 1 | u8 | dB Hz / 4 | states[N].cn0 | Carrier-to-Noise density. Zero implies invalid cn0. |
| | 3 <i>N</i> | | | | Total Payload Length |

MSG TRACKING IQ — 0x002D — 45

When enabled, a tracking channel can output the correlations at each update interval.

| Offset (bytes) | Size (bytes) | Format | Units | Name | Description |
|-------------------|--------------|--------|-------|------------|--|
| 0 | 1 | u8 | | channel | Tracking channel of origin |
| 1 | 1 | u8 | | sid.sat | Constellation-specific satellite identifier. This field for Glonass can either be (100+FCN) where FCN is in [-7,+6] or the Slot ID in [1,28] |
| 2 | 1 | u8 | | sid.code | Signal constellation, band and code |
| 4N + 3 | 2 | s16 | | corrs[N].I | In-phase correlation |
| 4N + 5 | 2 | s16 | | corrs[N].Q | Quadrature correlation |

7.9 User

Messages reserved for use by the user.

MSG USER DATA — 0x0800 — 2048

This message can contain any application specific user data up to a maximum length of 255 bytes per message.

| Offset (bytes) | Size (bytes) | Format | Units | Name | Description |
|----------------|--------------|--------|-------|----------|----------------------|
| 0 | N | u8[N] | | contents | User data payload |
| | Ν | | | | Total Payload Length |

7.10 Vehicle

Messages from a vehicle.

MSG ODOMETRY — 0x0903 — 2307

Message representing the x component of vehicle velocity in the user frame at the odometry reference point(s) specified by the user. The offset for the odometry reference point and the definition and origin of the user frame are defined through the device settings interface. There are 4 possible user-defined sources of this message which are labeled arbitrarily source 0 through 3.

| Offset (bytes) | Size (bytes) | Format | Units | Name | Description |
|----------------|--------------|--------|-------|----------|--|
| 0 | 4 | u32 | ms | tow | Time field representing either milliseconds in the GPS Week or local CPU time from the producing system in milliseconds. See the tow_source flag for the exact source of this timestamp. |
| 4 | 4 | s32 | mm/s | velocity | The signed forward component of vehicle velocity. |
| 8 | 1 | u8 | | flags | Status flags |
| | 9 | | | | Total Payload Length |
